PROFILE

SDET with 5+ years in quality assurance, including 3.5 years writing test automation in Python. I build and own end-to-end frameworks (Pytest + Playwright, Page Object Model) across web UI and API layers, wire them into CI/CD, and make failures diagnosable through structured Allure reporting.

Over the past year I have specialised in AI-assisted test engineering: I built an internal MCP server and a skill-based agent workflow that moved my team from hand-writing tests to reviewing agent-generated code, with deliberate attention to keeping model usage cheap.

CORE SKILLS

- **Automation:** Python (Pytest, unittest), JavaScript, Playwright, Cucumber (BDD), Page Object Model, FastAPI (internal tooling), PyOTP (2FA flows)
- **Test types:** End-to-end testing across web UI and REST API, regression testing, business-scenario coverage, fixture-based test data management, load testing with Locust (basic)
- **AI-assisted engineering:** Claude Code, Codex, Grok; Model Context Protocol (built an internal MCP server in Python); Agent Skills, hooks, harnesses; prompt caching and model routing for cost control
- **CI/CD & infrastructure:** GitHub Actions, GitLab CI, Azure DevOps Pipelines, Docker / Docker Compose, Git, Red Hat OpenShift, Linux CLI, SSH, ELK
- **API & data:** REST API testing, Postman, Swagger / OpenAPI, SQL (Oracle, MySQL, PostgreSQL / PGAdmin), RabbitMQ (basic)
- **Code quality:** Type hints, ruff, black, pre-commit hooks, peer code review
- **Reporting & process:** Allure, Jira, Confluence, TestRail, Zephyr, Slack; test planning, regression strategy, flaky-test triage
- **Domains:** Payments and payment infrastructure, multi-service cloud (SaaS) platforms, IoT and building management, smart TV and media devices

PROFESSIONAL EXPERIENCE

Senior Python QA Automation Engineer | **SD Solutions**

Dec 2025 - Present · Remote · Client: enterprise payments platform (NDA) · Automation team of 3

- Write Python + Playwright automation covering web applications and API services for a payments platform, extending the shared framework rather than only adding test cases.
- Cut the manual regression cycle from three days to roughly two hours by automating the business-critical scenarios the QA team had been running by hand.
- Built an internal MCP server in Python that gave the team's AI agents repo-native tools: pulling Jira tickets, running Pytest suites with Allure output, querying Oracle/MySQL for backend verification, tailing server logs over SSH, and posting results to Slack and Jira. Later migrated into Agent Skills as the team standardised on that format.
- Designed the team's agent workflow - Jira issue, staged implementation plan, agent implements stage by stage, engineer reviews plan and diff before the PR - shifting the engineer from author to reviewer and shortening the path from ticket to merged test.
- Introduced governance for agent work on my own initiative: a policy contract defining agent role and constraints, a harness with explicit input and output contracts for each unit of work, and tool-level restrictions blocking destructive database queries and limiting server commands.
- Kept AI usage economical through warm prompt caching and deliberate model routing - cheaper models for bulk generation, stronger ones reserved for planning and architecture.
- Contribute to internal FastAPI tools that help manual QA engineers triage and analyse tickets faster.
- Triage UI and backend failures by combining Playwright DOM snapshots with database and log verification, backed by a retry policy and rich failure context so intermittent failures get diagnosed rather than blindly re-run; review teammates' automation code.

Test Automation Engineer | **GlobalLogic**

Feb 2025 - Dec 2025 · Lviv, hybrid · Multi-service cloud platform for lift monitoring and management · Sole automation engineer

- Owned the test automation strategy and built the framework from scratch as the only automation engineer on the team - Python, Pytest and Playwright on a Page Object Model architecture.
- Automated the cloud and API side of the product in full across several applications and API services, leaving manual effort only for investigating failed runs.
- Validated the web interface down to the visual layer, including fonts and interface colours, alongside functional user flows.
- Integrated Allure reporting with step-level logs, debug data and screenshots on failure, so a failed run could be diagnosed from the report instead of a local re-run.

- Wired the suites into Azure CI/CD pipelines and put them on a daily schedule, so every morning started with a fresh regression report.

Automation QA Engineer | **Exoft**

Jun 2024 - Feb 2025 · Lviv · Web application

- Developed and maintained Playwright + JavaScript automation with Cucumber BDD, keeping scenarios readable for non-engineers.
- Tested backend APIs daily with Postman and Swagger - endpoint verification, payload and contract validation.
- Wrote SQL queries in PGAdmin for backend data verification and database integrity checks.
- Converted manual regression cases into automated scenarios together with the manual QA team, extending coverage of the core user flows.
- Managed deployment and test-environment resources in Red Hat OpenShift, keeping a stable environment available for suite runs.

Automation QA Engineer | **GlobalLogic**

Jan 2023 - Jun 2024 · Lviv · Smart TV devices and media applications

- Developed, maintained and refactored Python/unittest suites running against physical TV devices.
- Cut total suite execution time by ~30% by reworking the existing automated pipelines.
- Set up and maintained a physical automation lab environment to support client project demands.
- Ran root-cause analysis on device failures directly with US-based client engineers and proposed feature and coverage improvements.
- Used WebSocket device communication, regex log parsing and Linux tooling for diagnostics.

Manual QA Engineer | **GlobalLogic**

Oct 2020 - Dec 2022 · Lviv · Smart TV devices and media applications

- Ran functional, non-functional, performance and regression cycles for device and application releases.
- Took part in official certification processes with Google, Apple, Amazon and Netflix.
- Authored test cases and bug reports and analysed requirements in Jira, Confluence and TestRail.

EDUCATION

BSc in Computer Engineering - Lviv Polytechnic National University, 2024
